

Kismet Ecosystem Architecture v3: The Hybrid Google-verse

Status: Tailored Customization Strategy **Target:** Kismet Group Stakeholders (Hybrid Google/Microsoft Environment) **Core Philosophy:** "Operationalizing the Google-verse" (with Real-World Bridges)

Executive Summary

The goal remains to build the "Google-verse"—a connected operating system where data flows like electricity. However, we acknowledge the **Hybrid Reality**: while the *machine* runs on Google (AppSheet, Automation), the *humans* may still live in Microsoft (Outlook, Teams).

This strategy tailors the system to fit that daily reality without breaking the automation.

Phase 1: The "Memory" (Data Storage)

The Pivot: Moving from "Flat Sheets" to "Smart Relations"

The source text identified "Relational Topology" as the critical success factor. Google Sheets is often too fragile for this.

The Recommendation: Airtable (as the "Engine Room") If the client is open to it, we replace the complex Google Sheets backend with **Airtable**.

- **Why?** It enforces the relationships (Companies ↔ Contacts) automatically. You cannot "break" the data like you can in a spreadsheet.
- **The Microsoft Link:** Airtable looks and feels like a "Super Excel," which makes it familiar to Microsoft users, but it acts like a database for our AppSheet system.
- **Day-to-Day:** The Admin manages data integrity in Airtable; the Staff uses the AppSheet app.

Alternative (Cost-Conscious): AppSheet Database. Native to Google, free with the license, but has a worse UI for manual editing than Airtable.

Phase 2: The "Brain" (The App Interface)

Tailored for the "Microsoft Mindset"

The user interface (AppSheet) must bridge the gap between Google data and Microsoft habits.

2.1 The "Open in Outlook" Action

- **The Customization:** We do not force users to use Gmail.
- **The Feature:** Inside the AppSheet app, when a user clicks the "Email Client" button, we use a specific `mailto:` command.
- **Result:** It opens their **default** mail app (Outlook Mobile or Desktop), pre-filled with the template. The data stays in the Google-verse, but the communication happens where they are comfortable.

2.2 The "Excel Import" Bridge

- **The Reality:** Clients will still receive lead lists in Excel (`.xlsx`).

- **The Fix:** We build a specific "CSV/Excel Importer" view in AppSheet.
- **Workflow:**
 1. User gets an Excel file of leads via Outlook.
 2. User uploads it to the AppSheet "Drop Zone."
 3. **SIM Automation** (Google Script) converts the Excel file and pushes it into the Database automatically.

Phase 3: "SIM" Automations (Simple, Not Complex)

Replacing n8n with Native Scripts

We avoid fragile, complex external tools (like n8n) that require maintenance. We use "Set it and Forget it" native scripts.

3.1 The "Silent Observer" Script

Instead of a complex workflow diagram, we write a single Google Apps Script (The "SIM") attached to the database.

- **Trigger:** "On Form Submit" (e.g., a new Lead enters the system).
- **Action:**
 1. Clean the phone number format.
 2. Send the "Welcome" text via Twilio.
 3. Log the "Welcome Sent" timestamp.
- **Why it wins:** It runs on Google's servers 24/7 for free. No n8n server fees, no crashing.

3.2 The Outlook Calendar Sync

- **Challenge:** AppSheet writes to Google Calendar. The user checks Outlook Calendar.
- **The SIM Fix:** We set up a simple "Subscribe" link.
- **Action:** We generate a "Kismet Calendar" link from Google and add it to their Outlook as an "Internet Calendar."
- **Result:** They see their AppSheet appointments *inside* their Outlook view (Read-Only overlay). No complex 2-way sync software needed.

Phase 4: Day-to-Day User Stories (The "Google-verse" in Practice)

Scenario A: The Salesperson (Hybrid User)

- **08:00 AM:** Opens **Outlook** to check emails. Sees a reply from a lead.
- **08:05 AM:** Opens **AppSheet** on their phone (or desktop browser). Finds that contact.
- **08:06 AM:** Logs an interaction: "Client interested in Enterprise tier."
- **Automation:** The system automatically moves the deal stage from "Prospect" to "Negotiation" on the **Looker Studio** dashboard.
- **08:10 AM:** Clicks "Call" in AppSheet. Phone dialer opens. Call finishes.

- **Automation:** AppSheet prompts: "Log the outcome?" (Connected flow).

Scenario B: The Manager (The Dashboard Viewer)

- **09:00 AM:** Does not log into AppSheet.
- **09:05 AM:** Opens **Looker Studio** (embedded in a SharePoint site or Bookmarked).
- **Insight:** Sees the "Pipeline Velocity" chart. Notices "Jane" has 5 stuck deals.
- **Action:** Clicks a link in the report that opens the specific Deal in **AppSheet** to leave a comment.

Critical Gaps & "Tailored" Fixes

Gap	The Standard	The "Kismet Tailored" Fix
	Fix	
Data Mess	"Use Validation"	Airtable Backend: Strict types (Phone # vs Text) prevent bad data entry at the source.
Email Friction	"Switch to Gmail"	Outlook mailto: Triggers: We use deep links to trigger their existing Outlook apps.
Complexity	"Use n8n/Zapier"	Google Scripts (SIM): Hard-coded, robust scripts that live inside the ecosystem. Free & fast.
Adoption	"Watch Videos"	NotebookLM Context: We upload <i>their specific</i> Outlook/Excel processes into the AI so it answers "How do I export to Excel?"
